Try to incorporate as many levels of complexity as possible when designing your IA program.

recursion
Using an additional option (databases, web services, moldelling)
merging two or more sorted data structures
polymorphism
inheritance
encapsulation
parsing a text file
use of additional libraries
searching
Sorting

Lists
trees
trees
queues
hash table
objects as data records
user defined objects

Complex math equations
Data Validation
2d or more Array
Nested loops
Complex selection (nested if, if with multiple conditions or switch)
File i/o
arrays

User-defined methods with parameters (the parameters have to be useful and used within the method body)
User-defined methods with appropriate return values (primitives or objects)
User-defined methods
Loops
Simple selection (if–else)
GUI

user defined objects
